Chapter 1. Overview

This is a guide to understanding the terms, layouts, and use of the I/B/E/S Summary historical earnings estimate database.

Intended Readership

The I/B/E/S Summary History User Guide is intended for Refinitiv clients who receive History directly from Refinitiv and not via any third-party platform.

About The I/B/E/S Summary History File

Refinitiv's extensive historical data presents a unique opportunity for testing investment theories in a variety of global market conditions. Historical forecasts date back to 1976 in the US and 1987 non-US, providing the broadest and deepest knowledge base for back-testing and analysis.

Data is available for US and NON-US stocks and can be customized by region. Summary history is not limited to earnings per share data. Sales, cash flow, EBITDA, dividends per share and other forecast measures are also available.

The I/B/E/S Summary History File system was designed for use with relational database management systems (RDBMS). Its normalized file structure allows flexible updates and manipulation of the data.

Summary History files are organized by measures. Each file is specific to the measure and region.

Company Coverage in the Refinitiv Database

A company must have at least one Analyst coverage to be included in the I/B/E/S History files.

Inactive Companies in the Refinitiv Database

There may be cases where a company is no longer in existence or analysts are no longer contributing forecasts. Estimates will remain in I/B/E/S History in these cases. This helps keep the Refinitiv database free from survivorship bias.

Handling Mergers and Acquisitions

When two companies in the Refinitiv universe merge, the new company changed its Name, CUSIP or SEDOL, or Official Ticker, or any other identifier. The I/B/E/S ticker for the acquiring company will not change. This is done to preserve a historical timeline for the new company. In the Refinitiv historical databases, all data relating to the acquired company will stop as of the acquisition date.

Defining Fiscal Periods

The Refinitiv database contains estimate data for up to Five Annual Fiscal Periods, Eight Quarter Fiscal Periods, Four Semi-annual Periods, and Long-Term Growth.

Since all companies do not have the same fiscal year end, Refinitiv uses FY1, FY2, etc. to identify estimates for each unique period where the most recently reported actual is denoted with "0". Company's last reported annual is referred to as FY0, the most recently reported quarter is Q0, and the most recent semi-annual reported earnings is SAN0.

Using the reported periods as a base, the period end dates for all estimated periods are easily calculated. For example, if FY0 corresponds to December 2007 (the last reported annual), the FY1, FY2 and FY3 estimates are for the periods ending December 2008, 2009, and 2010, respectively. Looking at the quarterly periods, if Q0 refers to the period ended March 2008 (the last reported quarter), and then the Q1 estimate is for the June 2008 quarter.

Capitalization Differences and Accounting Changes

When a stock split occurs, Refinitiv immediately adjusts all current as well as historical estimates and actuals for consistency in reflecting the current capitalization. Refinitiv market specialists examine incoming data for stock splits, extraordinary items, accounting changes, anomalies, and inconsistencies. Rigorous quality control processes ensure consistency and comparability in estimates. A wide range of estimates reflects a wide range of analyst opinion—not the mixing of estimates on different accounting basis.

Refinitiv does not force analysts into forecasting on one accounting basis. In cases where an analyst follows a company on a basis that is different from the majority of analysts, this analyst's estimate will be footnoted and/or excluded from the mean.

International Financial Reporting Standards (IFRS) - 2005

In 2005, the European Union passed a regulation that requires listed European companies to comply with International Financial Reporting Standards (IFRS) for their consolidated financial statements. There is a limited exception for certain companies to delay implementation until 2007. Generally, the regulation applies to consolidated financial statements for accounting periods starting on or after 1 January 2005. Thus, for those companies with 12-month accounting periods covering the calendar year, IFRS first applied to periods ending on 31 December 2005. As a result, companies first published IFRS financial information as of 31 March 2005 (if they report quarterly) or as of 30 June 2005 (if they report semi-annually).

Estimates collected by Refinitiv will reflect the adoption of this ruling on a majority basis.

In addition to countries in Europe, IFRS will be adopted by parts of Asia, including Australia and New Zealand. For History, Refinitiv implemented IFRS for European countries effective May 23, 2005. The transition period to IFRS is visible for companies in Australia and New Zealand effective September 12, 2005.

Please note that effective May 23, 2005, the Company Level Footnote File was added to all History clients' feeds and is distributed monthly. The Company Level Footnote File (HSFCO.<REG>) is a file designed to alert clients of the basis of earnings data for a security on the company level at different points in time. (This file was added to both Summary and Detail History.)

FAS123(R)

On December 16, 2004, The Financial Accounting Standards Board (FASB) issued FAS123(R). This ruling requires companies to calculate the fair value of stock options granted to employees and amortize that amount over the vesting period as an expense through the income statement. FAS123(R) is currently effective for fiscal years beginning after June 15, 2005, with company transition choices of modified prospective, modified retrospective or early adoption. The effective date of the ruling was then extended from quarterly to annual periods beginning after June 15, 2005.

Estimates collected by Refinitiv will reflect the adoption of this ruling on a majority basis.

Chapter 2. File Delivery

Summary history consists of chronological snapshots of consensus level data taken on a monthly basis. The summary snapshots are as of the Thursday before the third Friday of every month (which is the Refinitiv monthly production cycle). Historical files are updated and delivered via electronic delivery (FTP) on a monthly basis.

Please note that historical files are archived on the ftp server until 8:00PM ET on the Wednesday before the start of the next monthly run at which time the last month's files are removed from all client ftp accounts. The history run starts on the 3rd Thursday of each month.

File posting times are adjusted for Daylight Savings Time.

History Subscription Levels

There are 2 package types for the Summary History product, Core and Premium. Core package includes EPS, CPS, DPS, EBG, PRE, REC, and SAL measure. Premium includes all the core measures plus additional 200+ measures. Refer to [Appendix A](#) for the complete list of measures.

- Companies with no subsidiaries are classified as Primary Consolidated, with no corresponding secondary data measures.
- For companies that carry two-basis (Parent and Consolidated), both primary and secondary data measures are available. The basis is determined based on the majority contributor submission and populated under the primary measure.
- The per-share data measures of UK companies are covered in BPN (pence) and the values for non-per share data measures are displayed in GBP (pounds). The label for all estimates is BPN.
- FFO is available for Canadian and US companies only.
- All per share measures data including Price Targets are adjusted for corporate actions represented as splits.
- Decimalization across applicable values can vary depending on the length of the respective fields. There are cases where no decimals are included or there are 1, 2, or 3 decimals available where possible.

Normalized History Files

Refinitiv follows companies based on their reporting currency. However, in some cases where the reporting currency does not reflect the clear majority of estimate submissions, Refinitiv may exercise the option to set the default based on the currency of the majority of estimate submissions. In cases where companies report in multiple currencies, Refinitiv will set the default currency based on the majority of estimate submissions.

As a result of currency fluctuations over time, starting with the April 2009 Monthly cycle, Refinitiv introduced an additional set of I/B/E/S Normalized historical files that include summary and detail data with normalized company default currencies. This new offering provides a smooth historical view of companies that have had a currency change over time and is intended to simplify clients' workflow.

- Summary Statistics
- Actuals Data
- Pricing & Ancillary
- Summary Statistics 2nd Mean
- Restated Actuals
- Price Targets Summary

What rules will be followed when producing the normalized Summary History files?

Estimates summary is converted to the latest company default currency by using the closing exchange rate as of the Wednesday prior to the monthly run of each stat period mean. Normalized Summary data is created by converting the Standard/Regular Summary History data.

Actuals in the summary file are converted to the latest company default currency by using the closing exchange rate as of the FYE date of the actual. When an exchange rate is unavailable for the date prior to the FYE date, the next available prior exchange rate is used.

How will changes to currency be reflected from month to month in the Summary files?

In the existing files, all estimates and actuals are provided in the default currency followed at the respective point in time. In the normalized files, all estimates and actuals will be supplied in the default currency followed as of the latest monthly run.

To illustrate:

Refinitiv started coverage of company ABC in January 2001 and the company was covered in USD. In March 2008, majority of the analyst covering company ABC started providing estimates in EUR. Therefore, Refinitiv changed the default currency to EUR. In the Detail and Summary Files prior to March 2008, all estimates and

actuals will be displayed in USD. Starting with the March 2008 monthly files, all previously supplied estimates in USD, will be displayed in EUR by converting values following the rules detailed in question #5.

Do any differences exist between the “normalized” and “standard/regular” History files?

Yes, a few changes will be noticed between the two versions:

- Only one Pricing & Ancillary file is available as part of the Normalized and Standard I/B/E/S Summary History (adjusted and unadjusted) that can be used with any measure data.
- Normalized files will not be available for the following measures as these are not affected by currency: GRM, ROA, ROE, EFR, NIM, NAL, TCO, CLR, CMR, COR, CSL, EVO, EXR, MLR, NIS, NCR, OCR, PMN, PRN, RNA, VCR, CRT, PLF and Recommendations. As a result, the Normalized ZIP files posted in clients' FTP accounts include the Standard version for the respective measures.

File Naming Conventions

Intuitive file naming conventions have been devised to allow users better understanding of the file content. All Summary History file names adhere to the following convention:

<Type><Measure><Name>.<Region>

<Type>	Represents a two-character mnemonic for the type of file, “HS” for history summary adjusted for stock splits or “us” for history summary unadjusted
<Measure>	Represents a three-character mnemonic for the measure
<Name>	Represents a two or three-character mnemonic for the specific file (summary, actuals, etc)
<Region>	Represents a two or three-character mnemonic for the region

For example, adjusted US EPS summary is named: "hsepssum.us" and unadjusted US EPS summary is "usepssum.us"

Compressed Files

Summary History files are grouped and zipped by subscription level. Zipped file names are of the form:

<TYPE>HIST_<CURTYPE>_<ADJOPT>_LEVEL<LVL>_<REG>.ZIP

<TYPE>	SUM for Summary History
<CURTYPE>	STANDARD (Standard history) or NORMALIZED (Normalized history)
<ADJOPT>	ADJ (adjusted for splits) or UNADJ (unadjusted for splits)
<LVL>	1, 2 (core measures) or 3 (premium measures) refer to measures table
<REG>	Two or three-character mnemonic for the region

For example:

- SUMHIST_STANDARD_ADJ_LEVEL<LVL>_<REG>.ZIP: includes Adjusted Standard Summary core/premium measure data files for the region
- SUMHIST_STANDARD_UNADJ_LEVEL<LVL>_<REG>.ZIP: includes Unadjusted Standard Summary core/premium measure data files for the region
- SUMHIST_NORMALIZED_ADJ_LEVEL<LVL>_<REG>.ZIP: includes Adjusted Normalized Summary core/premium measure data files for the region
- SUMHIST_NORMALIZED_UNADJ_LEVEL<LVL>_<REG>.ZIP: includes Unadjusted Normalized Summary data core/premium measure for the region
- HISTORY_SUPPLEMENTAL_LICENCE_3: includes the following supplemental files:

FILE NAMES	FILE NAMES	FILE NAMES
ADJFIELD.US	HSID.US	PID1.US
BRANFIELD.US	HSID_A.US	PID2
CURFIELD.US	HSNPAN.US	PREG
HRECBKRU.US	HSTRBCDATA.US	STAT
HRECIDU.US	HSTRBCDESC	USEPSPAN.US
HSEPSADJ.US	HSXRAT.US	USNPAN.US
HSEPSID.US	IDFIELD.US	
HSEPSPAN.US	MEA	
HSFCO.US	NCURFIL.US	

Note: Non per share measures (i.e., Pretax, Sales, Net Profit) are included in both the Adjusted and Unadjusted Level 2 and Level 3 packages. Measures representing ratios (i.e., ROA, ROE, Gross Margin) are included in both Standard and Normalized Level 3 packages.

Chapter 3. Summary History File Description and Layout

This section provides a brief description of each of the files included in the I/B/E/S Summary History Product.

Each file utilizes from one to six columns as primary keys, the columns or sets of columns to identify a row of data as unique. Primary keys are indicated by a # sign followed by a number next to the column header, i.e., D#4. The number dictates the order of the column within the key.

Note: Unavailable numbers are indicated by a minus sign followed by 9's to fill in the field (-99999). A zero indicates non-available or non-meaningful date values. A string of asterisks for an estimate or actual value indicates that the figure is too large to fit into the field.

Actuals Data Files

Actuals Data

Name (Adjusted): ACT<MEAS>.<REG> (Standard), NACT<MEAS>.<REG> (Normalized)
Name (Unadjusted): ACT<MEAS>U.<REG> (Standard), NACT<MEAS>U.<REG> (Normalized)
Level: Summary
Frequency: Monthly

The Actuals Data file is a new formatted file created to eliminate multiple format files for reported actuals content. The file includes Activation and Announce dates and timestamps along with the corresponding IBES stat periods. Files are available in all versions Standard Split adjusted, Normalized Split adjusted, Standard Unadjusted for Splits, Normalized Unadjusted for Splits and available with all I/B/E/S History (Detail and Summary) packages.

Actuals Data provides financial data relating to previous fiscal periods as reported by the company. Actuals for fiscal periods and interim periods are obtained from news services and company filings and adjusted by Refinitiv market specialists to be comparable to the estimates made by analysts. Reported earnings are entered into the database on the same basis as analysts' forecasts. In general earnings estimates are followed on an operating basis. Often, reported earnings are adjusted for accounting irregularities not included in the analysts' forecasts.

If/when a Company level currency changes, actual with the new currency is included for the last annual and quarterly periods if there is an actual for those periods at the time the currency was changed. Actuals in the old currency is no longer included starting with those periods.

For example, the last reported period at the time of the currency change took place was June 2009 FY and Sep 2009 Q. The EPS values were -0.07 AUD and 0.02 AUD, respectively. The currency change took place on March 18, 2010. The actuals that appear in the Detail History Actuals file starting on March 18, 2010, are -0.05 USD and 0.02 USD, respectively.

Note: Restated Actuals are not included in this file. Please see File #3 below.

Key	Item	Format	Length	Start	End	Comments
A #1	I/B/E/S Ticker	CCCCCC	6	1	6	
B #2	Measure	CCCCCC	6	8	13	See Measures chart

L	5-year EPS Growth	999.99	6	86	91	
M	5-year EPS Stability	999.99	6	93	98	

Note: Fields J and K, 5-year EPS Growth and 5-year EPS Stability values are the same for EPS and non-EPS measure files.

Go-Forward Actuals Data

Name (Adjusted): ACT<MEAS>G.<REG> (Standard), NACT<MEAS>G.<REG> (Normalized)
Name (Unadjusted): ACT<MEAS>GU.<REG> (Standard), NACT<MEAS>GU.<REG> (Normalized)
Level: Summary and Detail
Frequency: Monthly

The Go-Forward Actuals Data file includes supplemental set of actuals called go-forward actuals. This set of reported data represents actuals that are on the same accounting basis as majority of the analysts, established for the next period to be reported. In the event a comparable actual for a period is recorded, and a go-forward majority is later established on a different accounting basis for the next reporting period, a go-forward actual will also be recorded indicating the majority basis change.

Both the actuals and go-forward actual are available in parallel in the two separate actuals files (2a and 2b) and will share the same announce and activation dates. Clients can choose to use both sets or the one that best fits their needs.

Key	Item	Format	Length	Start	End	Comments

Surprise History

Name (Adjusted): HSURP<MEAS>.<REG>, NHSURP<MEAS>.<REG> (Normalized)
Name (Unadjusted): UHSURP<MEAS>.<REG>, UNHSURP<MEAS>.<REG> (Normalized)
Level: Summary
Frequency: Monthly

The Surprise History file includes surprise data for all companies globally where a surprise mean exists, across all measures (except for Recommendations and Price Targets). One file is available per measure and clients receive Surprise History files for the measures they subscribe to.

Surprise mean values are provided whether an actual does or does not exist for a given period and is available for active and inactive companies. If underlying data used for calculating the surprise data is modified, updated historical surprise data will appear in the subsequent historical file update.

Currency of the surprise mean can be determined by cross referencing the I/B/E/S History Actuals file (Detail or Summary).

Summary Estimates Data Files

Summary Statistics

Name (Adjusted): HS<MEAS>SUM.<REG>, HS<MEAS>NSUM.<REG> (Normalized)
Name (Unadjusted): US<measure>SUM.<reg>, US<MEAS>NSUM.<REG> (Normalized)
Level: Summary
Frequency: Monthly

Summary Statistics contains one record for each forecast period for each Refinitiv statistical period. The forecast period represents the period end for which the forecasts were made for while the Refinitiv statistical period is the date when the set of summary statistics was calculated.

This file contains one record for each statistical period per estimate flag. For data on either Parent or Consolidated basis separate records are included.

Key	Item	Format	Length	Start	End	Comments

Summary Statistics (2nd mean)

Name (Adjusted) : 2SSUM<MEAS>.<REG>, HSN2SSUM<MEAS>.<REG> (Normalized)

Name (Unadjusted) : 2SSUM<MEAS>.<REG>, USN2SSUM<MEAS>.<REG> (Normalized)

Level: Summary

Frequency: Monthly

Summary Statistics (2nd Mean) provides the minority mean for a security both before and during IFRS compliance. When Pre-IFRS data is in the minority, the 2nd mean will reflect an IFRS mean. When IFRS becomes the majority, the 2nd mean will reflect non-IFRS estimates.

Adjustment Factors

Name HS<MEAS>ADJ.<REG>

Level: Summary

Frequency: Monthly

The Adjustments Factors file includes split factors and the first Refinitiv monthly production run (statistical period) that occurs after the split. For example, if a split took place on June 3, 2005, then the Refinitiv Statistical Period corresponding to the split will be June 16, 2005 (the date of the monthly run for June, the Thursday before the third Friday). The split factors included are cumulative. The Adjustments Factor File can be used to adjust back historical estimates to reflect the values as they were at the time (pre-split).

Refinitiv data reflects all splits up to the most recent Refinitiv statistical period; the split factors are not required for normal usage of the data. The data can be unadjusted by dividing or multiplying by the cumulative split factor. Multiply all per share related data in monetary units by the adjustment factor and divide the shares outstanding to

get numbers as they were as of the Refinitiv statistical period. Note that in some cases, only the split factor of the earliest Refinitiv statistical period is available, but not the actual date of the split.

Unadjusted for splits files are also available in separate packages.

Supplemental Files

Company Identification

Name: HS<MEAS>ID.<REG>

Level: Summary

Frequency: Monthly

The Company Identification file provides important cross-reference information allowing the user to map I/B/E/S tickers to official tickers, CUSIP, SEDOL. This allows for easy integration of data across the I/B/E/S files as well as datasets that use other identifiers. I/B/E/S tickers for international (NON-US and Canadian) companies are preceded by an "@" sign.

The CUSIP/SEDOL field will have a CUSIP for companies in the US identifier file and SEDOL for companies in the NON-US identifier file. SEDOL's include a country code followed by the first six digits of the official SEDOL (the last digit of a SEDOL is a check digit and is not used by I/B/E/S).

SEDOLs were originally designed to be a unique 7-digit numeric code. By 2004, the London Stock Exchange (LSE), which issues SEDOLs, reached its capacity. Consequently, the LSE modified its specification to its current state which is a unique 7-character alphanumeric code. Clients can identify a valid SEDOL if it is a 7-digit numeric (i.e., 1234567) or the first character is an alpha character followed by the numeric characters (i.e., A1234567). Dummy SEDOLs (used for some inactive companies) are normally numeric followed by XX (12345XX) or mostly alpha characters followed by numeric (DUMMY12).

The Currency Flag is used in the US file to identify companies followed in Canadian Dollars in the US file.

The Parent/Consolidated flag appears only in NON-US files and the field is populated with a "P" when the company is followed on a Parent basis and is Null when the company is followed on a Consolidated basis. Canadian companies included in the INT files; a designation of "C" identifies companies followed in Canadian dollars. If there is no designation present, then the Canadian company is followed in US dollars.

Company Identification is a time series of Name, Ticker and CUSIP changes for each company.

Space is reserved at the end of the file to accommodate inclusion of additional ID fields that may be added in the future. This is designed to minimize potential impact on existing programs in the event of an addition.

This file contains one record for each change in any of the fields. The Start Date is that of the first Refinitiv statistical period, for which the new identifier combination should be used. The start date is always the upcoming monthly run date after an initiation, or a change has taken place. If, for example, the name change for a company

is entered into the database on March 4 and the upcoming monthly run date is March 15, then the start date will be seen as March 15.

Pricing & Ancillary

Name (Adjusted): HS<MEAS>PAN.<REG>, HSNPAN.<REG> (Normalized)

Name (Unadjusted): US<MEAS>PAN.<REG>, USNPAN.<REG> (Normalized)

Level: Summary

Frequency: Monthly

The Pricing & Ancillary file contains two blocks. The first block contains basic information such as the I/B/E/S ticker and the statistical period while the second block carries pricing and ancillary data for each company.

There is one record for each I/B/E/S statistical period.

Shares Outstanding included for U.S. companies - majority of the contributing analysts provide forecasts for a single class of common shares. If two classes of shares exist, Refinitiv uses the class of shares that is generally available to investors. In non-U.S. markets however, this issue is somewhat less direct as there are often multiple classes of shares. Here the Refinitiv convention is to include the class that the majority of analysts are covering. Secondary considerations are which class of shares has the highest public float and whether a given class of shares is available to non-nationals.

Level: Summary and Detail
Frequency: Monthly

The TRBC Description file replaces the SIG file and is based on the TRBC type per I/B/E/S ticker

Refinitiv Business Classification

Refinitiv I/B/E/S introduced a new set of Sector, Industry and Group identifier known as Refinitiv Business Classification (TRBC). TRBC is an industry classification system that is owned and operated by Refinitiv. The Market-oriented system tracks the primary business of a corporation and reflects global industry practices by grouping together correlated companies that offer products and services into similar end markets.

TRBC data is used by the investment community for navigation, aggregation, and benchmarking. It provides a global standard for intelligently identifying peers, tagging research, aggregation financial content and transforming the torrent of Refinitiv news and information into insightful trends. It delivers a solid foundation for aggregating financial ratios, portfolio benchmarking and attribution analysis.

This balances the needs of index construction and information navigation. TRBC has set its granularity level to meet both navigation and benchmarking requirements. The schema is detailed enough to allow the accurate pinpointing of peers while delivering a stable and useful grouping of constituents to allow benchmarking and index construction across the globe and between multiple periods.

Refinitiv I/B/E/S added the following TRBC mapping of its data.

- TRBC Economic Sector
- TRBC Business Sector
- TRBC Industry Group
- TRBC Industry
- TRBC Activity

Key	Item	Format	Length
A#1	TRBC PermID		10
B	TRBC Short Description		255
C	Measure		1024

Note: *TRBC Activity is an additional level of analysis to monitor niche industries and themes such as Luxury, Cleantech and Infrastructure.

Summary Price Target Files

Price Targets (PTG) Summary

Name (Adjusted): HSPTGSUM.<REG>, HSPTGNSUM.<REG> (Normalized)

Name(Unadjusted): USPTGSUM.<REG>, USPTGNSUM.<REG> (Normalized)

Level: Summary

Frequency: Monthly

Price Target represents the projected price level forecasted by the analyst within a specific time horizon. Historical data is available as far back as March 1999.

Price target summary values are calculated based on the 12-month horizon.

Summary Recommendation Files

Summary Recommendations

Name: HSREC.<REG>

Level: Summary

Frequency: Monthly

Summary Recommendations contains one record for each forecast period for each Refinitiv statistical period. The forecast period is the fiscal year for which the recommendations were made while the Refinitiv statistical (Stat) period is the date when the set of summary statistics was calculated.

This file provides an average recommendation as well as the number of recommendations up and down for all recommendations that have changed or added since close of previous business day. Summary recommendation means are calculated by assigning to each contributing analyst's Recommendation an integer based on a 5 standardized Refinitiv Recommendation scale and calculating a real number average.

The scale is as follows:

1. Strong Buy
2. Buy
3. Hold
4. Underperform
5. Sell

Recommendations ID

Name: HSID.<REG>

Level: Summary

Frequency: Monthly

The Recommendations ID File is a time series of company name, ticker and CUSIP/SEDOL changes for each company for which recommendations data is available in the Recommendations Summary files. This file contains one record for each change in any of the fields. The Start Date is that of the first Refinitiv statistical period for which the new identifier combination should be used.

The CUSIP/SEDOL field will have a CUSIP for companies in the US identifier file and SEDOL for companies in the NON-US identifier file. SEDOL's include a country code followed by the first six digits of the official SEDOL (the last digit of a SEDOL is a check digit and is not used by I/B/E/S).

SEDOLs were originally designed to be a unique 7-digit numeric code. By 2004, the London Stock Exchange (LSE), which issues SEDOLs, reached its capacity. Consequently, the LSE modified its specification to its current state which is a unique 7-character alphanumeric code. Clients can identify a valid SEDOL if it is a 7-digit numeric (i.e., 1234567) or the first character is an alpha character followed by the numeric characters (i.e., A1234567).

Identifier Layout

This section summarizes key columns, formats, and timestamps used to interpret history records. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. When integrating downstream, treat currency and period identifiers as record-specific attributes. **Name (Adjusted):** HS<MEAS>PAN.<REG, HSK<MMM>NSUM.<REG, HSUMREC.<REG

Level: Normalized

Frequency: Weekly

- Keys and statistical periods enable consistent joins across files.
- Record-level fields are presented in fixed-width layouts.

Note: Exchange rate files can be used to convert values to alternate currencies.

Chapter 3. File Description and Layout

Identifier Layout

Use the fields below to join ticker, measure, periodicity, and statistical period identifiers across files. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. When integrating downstream, treat currency and period identifiers as record-specific attributes. **Name (Adjusted):** UNHSURP<MEAS>.<REG>

Name (Unadjusted): US<MEAS>NSUM.<REG>

Level: Detail

Frequency: Weekly **Note:** Some fields may be blank where not applicable.

data files for KPI measures for the region

Actuals Data Layout

Use the fields below to join ticker, measure, periodicity, and statistical period identifiers across files. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. **Name (Adjusted):** NHSURP<MEAS>.<REG, 24.32, HSTRBCDATA.<REG

Level: Summary

Frequency: Daily/Historical

- Record-level fields are presented in fixed-width layouts.
- Timestamps support change tracking and reconciliation.
- Keys and statistical periods enable consistent joins across files.

Note: Some fields may be blank where not applicable.

Key	Data Field	Data Type	Data Length	Comments

Identifier Layout

Use the fields below to join ticker, measure, periodicity, and statistical period identifiers across files. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. **Name:** SUMHIST_STANDARD_UNADJ_LEVEL<LVL>_<REG>.ZIP, 8.771

Level: Summary

Frequency: Weekly

- Some files represent snapshots; others represent incremental updates.
- Record-level fields are presented in fixed-width layouts.
- Timestamps support change tracking and reconciliation.

Note: Unavailable numeric values may be represented using sentinel values depending on file format.

Pricing and Ancillary Layout

This section summarizes key columns, formats, and timestamps used to interpret history records. Primary keys and statistical period identifiers support time-series integration. **Name:** 999999999.99

Level: Detail

Frequency: Daily/Historical

- Some files represent snapshots; others represent incremental updates.
- Timestamps support change tracking and reconciliation.
- Record-level fields are presented in fixed-width layouts.

File Name: MEAS

Summary Statistics Layout

This section summarizes key columns, formats, and timestamps used to interpret history records. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. When integrating downstream, treat currency and period identifiers as record-specific attributes. **Name (Adjusted):** HSID.<REG, 17.00, ACTK<MMM>.<REG

Level: Normalized

Frequency: Weekly

- Keys and statistical periods enable consistent joins across files.
- Record-level fields are presented in fixed-width layouts.
- Timestamps support change tracking and reconciliation.

Note: Mapping tables can be used to translate identifiers across related datasets.

File Name: PREG

Currency Conversion Layout

Columns and indicators support currency handling, consensus calculations, and time-series integration. Primary keys and statistical period identifiers support time-series integration. When integrating downstream, treat currency and period identifiers as record-specific attributes. **Name (Adjusted):** 24.32

Name (Unadjusted): NACTK<MMM>.<REG

Level: Normalized

Frequency: Monthly

- Keys and statistical periods enable consistent joins across files.
- Timestamps support change tracking and reconciliation.
- Some files represent snapshots; others represent incremental updates.

KPI Summary Layout

Columns and indicators support currency handling, consensus calculations, and time-series integration. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. When integrating downstream, treat currency and period identifiers as record-specific attributes. **Name (Adjusted):** 999999.999, 9999999.999

Level: Detail

Frequency: Daily

- Some files represent snapshots; others represent incremental updates.
- Record-level fields are presented in fixed-width layouts.
- Timestamps support change tracking and reconciliation.

Identifier Layout

This section summarizes key columns, formats, and timestamps used to interpret history records. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. **Name (Adjusted):** SUMHIST_NORMALIZED_ADJ_LEVEL<LVL>_<REG>.ZIP

Level: Standard

Frequency: Historical

- Record-level fields are presented in fixed-width layouts.
- Timestamps support change tracking and reconciliation.
- Keys and statistical periods enable consistent joins across files.

Note: Unavailable numeric values may be represented using sentinel values depending on file format.

Category File Name Description

Identifier Layout

Use the fields below to join ticker, measure, periodicity, and statistical period identifiers across files. Fields may include activation and announce timestamps depending on record type. Primary keys and statistical period identifiers support time-series integration. **Name (Adjusted):** UHSURP<MEAS> . <REG

Level: Normalized

Frequency: Daily

- Some files represent snapshots; others represent incremental updates.
- Record-level fields are presented in fixed-width layouts.
- Timestamps support change tracking and reconciliation.

Note: Unavailable numeric values may be represented using sentinel values depending on file format.

Chapter 4. Currency Conversion

A default currency is assigned to every company under coverage. Estimates received in currency other than the default currency are converted to the company-level default currency for the mean calculation.

Company - Level Currency Changes

The default currency assigned to a company may change over time. Possible reasons for the change include a company changing its reporting currency or the majority of analysts submitting estimates in a new currency.

The change in currency for a company in the Summary History file will be displayed in the currency code field in both the Actuals Data file (hsepsact.int) and the Summary Statistics file (hsepssum.int).

Example A (Mean Data)

In cases where the default currency changes, the mean estimates are displayed in the new currency starting the monthly stat period when the change became effective. The historical mean estimates remain in the currency they were originally recorded.

Records from the Summary Statistics File (hsepssum.int) for statistical periods August 16, 2001 – January 17, 2002

Ticker	Stat Period	Measure	Fiscal Period	FP End Date	FP Mean Measure	Currency Code
@5RO	20010816	EPS	ANN	200412	24.98	NOK
@5RO	20010920	EPS	ANN	200412	24.98	NOK
@5RO	20011018	EPS	ANN	200412	24.32	NOK
@5RO	20011115	EPS	ANN	200412	2.03	USD
@5RO	20011220	EPS	ANN	200412	2.20	USD
@5RO	20020117	EPS	ANN	200412	2.20	USD

Example B (Actuals Data)

In cases where the default currency changes, the actuals are displayed in the new currency starting the monthly stat period when the change became effective. The historical actuals remain in the currency they were originally recorded.

Records from the Actuals File for statistical periods August 16, 2001 – January 17, 2002

Ticker	Stat Period	Measure	Currency Code	FYO End Date	FYO Actual
@5RO	20010816	EPS	NOK	200012	17.00
@5RO	20010920	EPS	NOK	200012	17.00
@5RO	20011018	EPS	NOK	200012	17.00
@5RO	20011115	EPS	USD	200012	2.34
@5RO	20011220	EPS	USD	200012	2.34
@5RO	20020117	EPS	USD	200012	2.34

Guidelines to Convert to an Alternate Currency

To view a time series of actuals and mean estimates in one common currency, the Monthly Exchange Rate File (hsxrat.int) may be used. This file shows conversion rates to the US Dollar (USD) on a month-by-month basis. The publication date's exchange rate for the record's stat_period may be used to convert.

Example A (Mean Data)

To convert NOK mean of 24.32 to USD for the October 18, 2001 stat period, divide 24.32 by the exchange rate of 8.771 from publication date in October 2001. The result is 2.77 in USD.

Records from the Summary Statistics File (hsepssum.int) for statistical periods August 16, 2001 – January 17, 2002

Ticker	Stat Period	Measure	Fiscal Period	FP End Date	FP Mean Measure	Currency Code
@5RO	20010816	EPS	ANN	200412	24.98	NOK
@5RO	20010920	EPS	ANN	200412	24.98	NOK

Ticker	Stat Period	Measure	Fiscal Period	FP End Date	FP Mean Measure	Currency Code
@5RO	20011018	EPS	ANN	200412	24.32	NOK
@5RO	20011115	EPS	ANN	200412	2.03	USD
@5RO	20011220	EPS	ANN	200412	2.20	USD
@5RO	20020117	EPS	ANN	200412	2.20	USD

Record from the Monthly Exchange Rate File (hsxrat.int)

Publication Date	Exchange Rate	Currency Code
011017	8.771	NOK

Example B (Actuals Data)

To convert NOK actual of 17.00 to USD for the October 15, 2001, stat period, divide 17.00 by the exchange rate of 8.771 from publication date in October 2001. The result is 20.8072 in NOK.1.94

Records from the Actuals File for statistical periods August 16, 2001 – January 17, 2002

Ticker	Stat Period	Measure	Fiscal Period	FP End Date	FP Mean Measure	Currency Code
@5RO	20010816	EPS	NOK	200012	17.00	@5RO
@5RO	20010920	EPS	NOK	200012	17.00	@5RO
@5RO	20011018	EPS	NOK	200012	17.00	@5RO
@5RO	20011115	EPS	USD	200012	2.34	@5RO
@5RO	20011220	EPS	USD	200012	2.34	@5RO
@5RO	20020117	EPS	USD	200012	2.34	@5RO

Record from the Monthly Exchange Rate File (hsxrat.int)

Publication Date	Exchange Rate	Currency Code
011017	8.771	NOK

Chapter 5. KPI Files

KPI File Overview **Historical files** are delivered during the IBES monthly history production, the data cut off being as of every Thursday before the 3rd Friday of the month. The file delivery deadline is Wednesdays after the 3rd Friday of the month at 6 AM EST.

Retrieving KPI Files

KPI files are generally ready before the stated times in the documentation. Previous week's files are deleted the day before the KPI files are due to be posted. Users can set up an automated process to check and download files as soon as they are available in their FTP account. The process should continue to check the FTP account at intervals until files are available.

Historical files are grouped and zipped by subscription level.

The History type KPI package zip file name is:

<TYPE>HIST_<CURTYPE>_<ADJOPT>_LEVEL<LVL>_<REG>.ZIP
<TYPE> **SUM** for Summary History
<CURTYPE> **STANDARD** (Standard history) or **NORMALIZED** (Normalized history)
<ADJOPT> **ADJ** (adjusted for splits) or **UNADJ** (unadjusted for splits)
<LVL> 3K
<REG> Two or three-character mnemonic for the region

Company-level and product-level KPI measure files, including all types of sales such as Same Store Sales, Pharmaceutical Sales, Business Segment Sales and Geographical Segment Sales measures, will be included in an additional ZIP file under the "history" FTP folder. The existing Zip file naming convention is used where the Level = 3K

Example: SUMHIST_STANDARD_ADJ_LEVEL3K_INT.ZIP: includes Adjusted Standard Summary data files for KPI measures Same Store Sales and Pharmaceutical Sales for the INT region

Regional files included in the package are:

KPI Measure	Regional Packages	File Extensions
Pharmaceutical Sales	United States, Canada or International	.US, .INT
Same Store Sales	United States	.US

Example:

- SUMHIST_STANDARD_ADJ_LEVEL<LVL>_<REG>.ZIP: includes Adjusted Standard Detail data files for KPI measures for the region
- SUMHIST_STANDARD_UNADJ_LEVEL<LVL>_<REG>.ZIP: includes Unadjusted Standard Detail data files for KPI measures for the region
- SUMHIST_NORMALIZED_ADJ_LEVEL<LVL>_<REG>.ZIP: includes Adjusted Normalized Detail data files for KPI measures for the region
- SUMHIST_NORMALIZED_UNADJ_LEVEL<LVL>_<REG>.ZIP: includes Unadjusted Normalized Detail data files for KPI measures for the region

Appendix I: Glossary

Term	Definition
Actual flag	The actual flag allows for the inclusion of different types of actuals (primary and secondary) for the same company.
Canadian Currency or Parent/Consolidated Flag	The flag has different usages in the US and non-US file. Its purpose for Canadian companies is to mark the companies whose currency is Canadian. For non-US companies it is a way to differentiate between companies reporting on a parent or consolidated basis.
Company Name	Full or abbreviated name of the company.
Country ID	The country ID is the Refinitiv abbreviation for the company's country of domicile.
Cumulative Adjustment Factor	Cumulative factor that has been applied to historical data to adjust for splits and capitalization changes (Adjustment factors multiplied together).
Currency	A three-digit abbreviation indicating denomination of estimate data.
CUSIP/SEDOL	CUSIP and SEDOL are unique alphanumeric identifiers for individual securities. Refinitiv uses the first 8 digits for CUSIP, and two-character Country Code followed by the first 6 digits of SEDOL in its database.
Dilution Factor	A measure of the difference between primary and fully diluted earnings per share.
Exchange Code	This code indicates the exchange in which the stock is listed on.
Estimate Flag	The estimate flag allows for the inclusion of different types of estimates (primary and secondary) for the same company.
Exchange Rate	Exchange rate as of the Refinitiv Publication Date.
Five-year EPS Growth	A measure of the average annualized EPS growth over the past 5 years.
Five-year EPS Stability	A gauge of EPS growth consistency over the past 5 years.
Forecast Period Indicator	Each fiscal period (FY1, FY2, Q1, etc.) is given a numerical value. This allows company comparison regardless of FY end. FY year-end can be cross-referenced through the Forecast period end date. See Appendix.
Group Abbreviation	Coded abbreviation of Group Name.
Group Name	Tertiary division based on business activity.
High Estimate	The greatest value in a set of estimates for a company, for the specified fiscal period.
I/B/E/S CUSIP	The I/B/E/S CUSIP is a Refinitiv convention that helps differentiate CUSIPs for US companies from SEDOLs for non-US companies. The I/B/E/S CUSIP for US is the company's 8-character CUSIP. The I/B/E/S CUSIP for non-US companies is the 6-character SEDOL, preceded by a two-digit country code. I/B/E/S CUSIPs do not include the check sum digit.
I/B/E/S Ticker	Unique identifier supplied by Refinitiv. This variable should be used to link data across files and time periods as it will not change and will remain unique.
Indicated Annual Dividend	The dividend data provided is the indicated annual dividend as of the Refinitiv statistical period. It represents the last 12 months of total dividend data. Our pricing vendor supplies this data.

Term	Definition
Industry Abbreviation	Is the abbreviation for Industry Name
Industry Name	Secondary division based on business activity.
Instrument Flag	This indicates the security's type of instrument, i.e., ADR, stock, dual listing.
Low Estimate	The smallest value in a set of estimates for a company, for the specified fiscal period.
Mean Estimate	The consensus estimate; the arithmetic average of all outstanding estimates for a particular fiscal period.
Measure	Data type indicator (i.e. EPS, CPS, DPS etc.)
Median	Estimate which falls in the middle of the defined range of Estimates when arranged in ascending or descending order.
Number of Estimates	The total number of estimators covering the company for the fiscal period.
Number of Estimates Up	The number of upward revisions since the last monthly production.
Number of Estimates Down	The number of downward revisions since the last monthly production.
Official Ticker	Official trading ticker of company (limited to first four characters).
Parent / Consolidated Flag	Indicates whether earnings forecasts are provided on a Parent or Consolidated basis.
Periodicity	Indicates whether a record is for a quarter, semi-annual or year end. (Please refer to Appendix).
Price	Please note that Refinitiv's pricing information is issue-specific. The price will be the last closing price available to Refinitiv before the statistics were calculated.
Pricing Date	The date of the last available price. Please note the following for pricing date: Non-US pricing is as of the Tuesday of the week of the monthly cut and US pricing is as of the Wednesday of the week of the monthly cut.
Primary / Diluted	The flag that indicates the basis in which the company reports.
Reported Period End Date	Year and month corresponding to the close of a company's business period.
Review Date(YYMMDD)	Most recent date that an estimate was confirmed as accurate.
Sector Abbreviation	Coded abbreviation for Sector Name.
Sector Name	Primary division based upon business activity.
Shares Outstanding	The total number of shares outstanding. This data item is also issue-specific.
Split Date	The date of the individual splits. Currently this field is not populated in the file.
Split Factor	This field lists the cumulative split factors. The cumulative split factor is derived by multiplying individual splits up to a specific time to allow for simple un-adjustment of data.
Standard Deviation	The statistical measure of dispersion of estimates for the fiscal period indicated.
Start date	Date when variable first appeared in the I/B/E/S database.
Value	Estimate
